PSF Fitting Photometry

- Method 2:
 - Use co-added image for source detection

PSF Fitting Photometry

- Method 2:
 - Use to find objects in individual images

PSF Fitting Photometry

- Method 2:
 - PSF subtract on each image, create mean catalogue

PSF Fitting Photometry

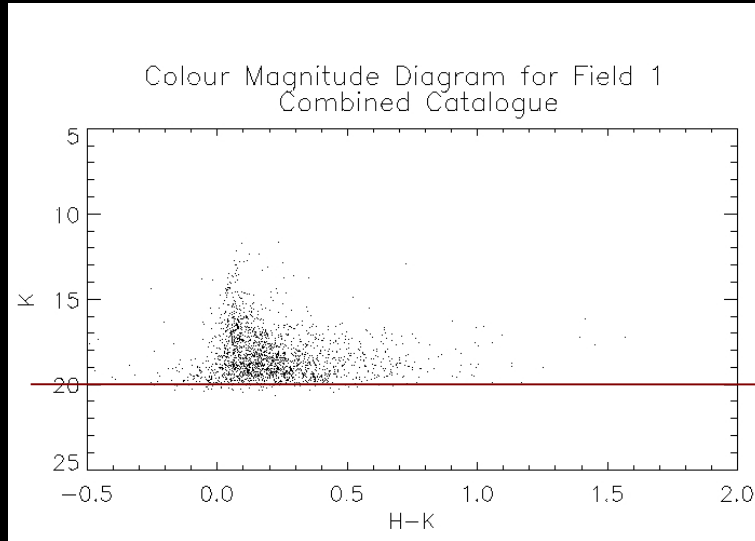

- Pro:
 - Larger FoV
 - Potentially better PSF fitting
- Con:
 - Potentially lower S/N

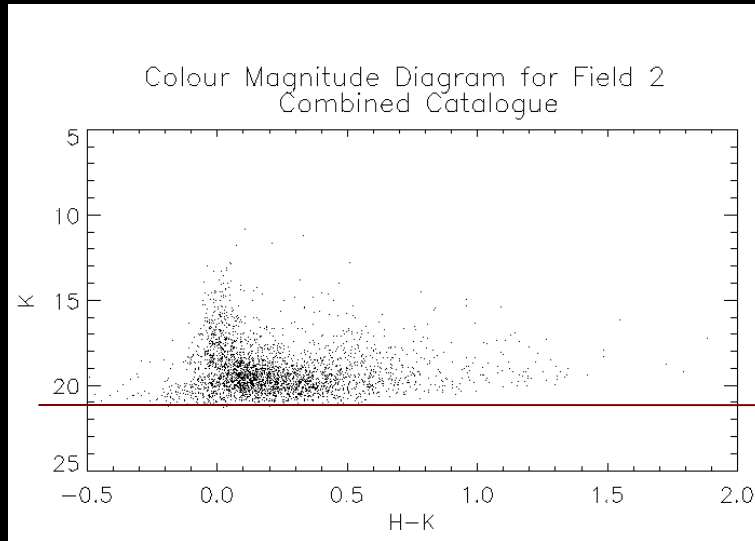

Zero Point Uncertainty Comparison

	ΔK p1	ΔK p2	ΔK p3	ΔH p1	ΔH p2	ΔH p3
Combined Method	± 0.13	± 0.45	± 0.25	± 0.14	± 0.32	± 0.08
Individual Method	± 0.14	± 0.45	± 0.24	± 0.14	± 0.31	± 0.08

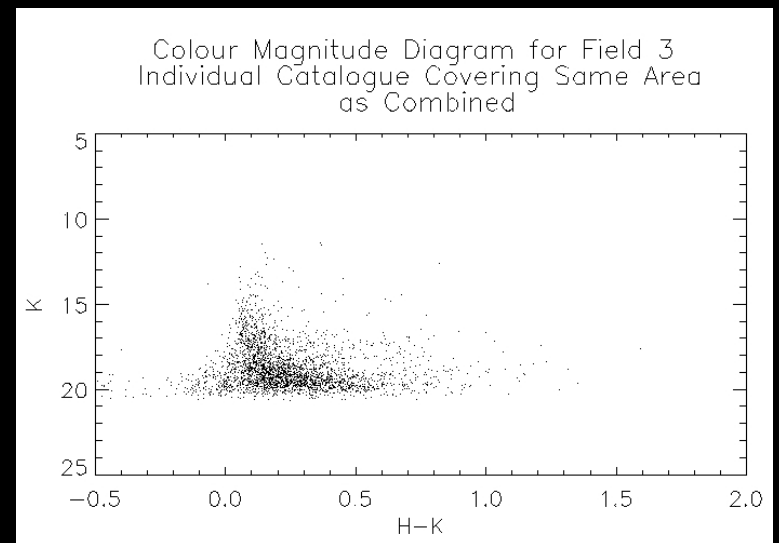

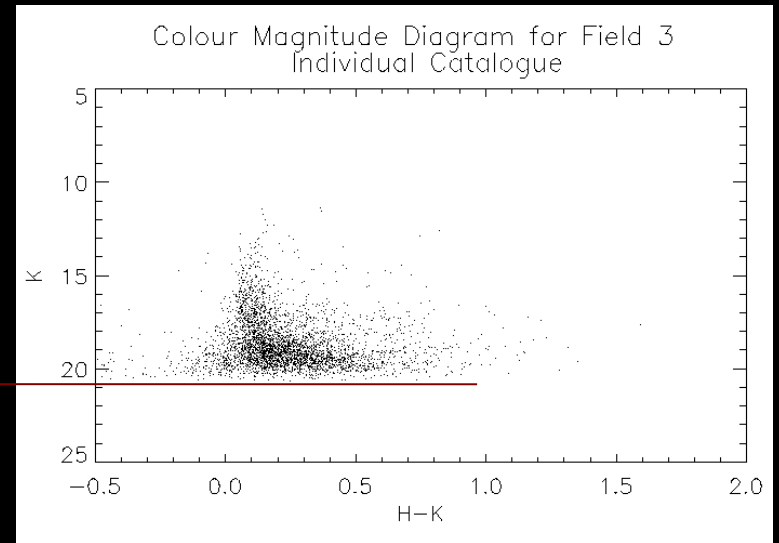

CMDs for Pointing 1

CMDs for Pointing 2

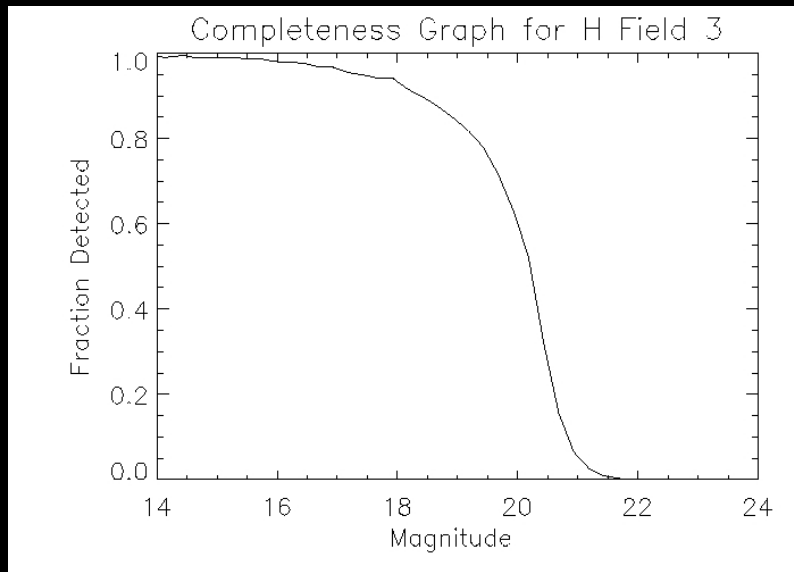

CMDs for Pointing 3

Analysis

- Zero Point uncertainty – Little difference
- Loss in sensitivity – Minimal
- CMDs – More data points with individual technique

Completeness

50% complete at H ~ 20.5
12 min exp.
5 σ detections

Completeness

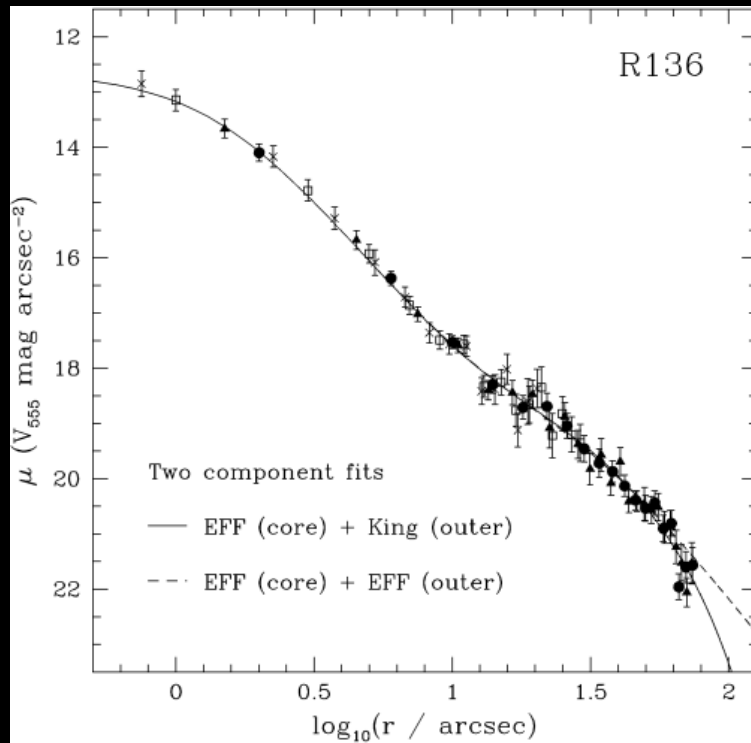

50% complete at K ~ 19.5
24 min exp.
5 σ detections

Conclusions

- Uniform corrections between NGS
- High strehl ratio
- Limited Calibration Sources without Hawk-I
- Gains from individual frame subtractions

Still to do

- Overlap CMD values
- Look at completeness effects on the radial profile
- Benefits from reducing number of images
- IMF
