

Moderate Resolution NIR Spectra and Modeling **the Secondary Stars** of Cataclysmic Variables

Ryan T. Hamilton (New Mexico State University)

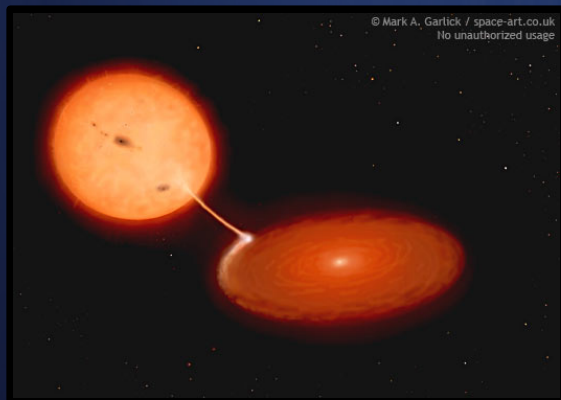

Tom Harrison (Advisor, NMSU), Steve Howell (NOAO), Claus Tappert (Universidad de Valparaiso), Paula Szkody (U. Washington)
Katia Cunha (NOAO), ...And Many More

Talk Outline

- (Very Brief) Introduction
 - Why Bother? Secondaries should be dull...
 - UV C IV/N V ratios
 - Recent NIR Observations
- UV-NIR Link and implications
- Description of Ph.D. thesis work
 - Very much a work-in-progress and just getting up and running
 - Results coming soon :)

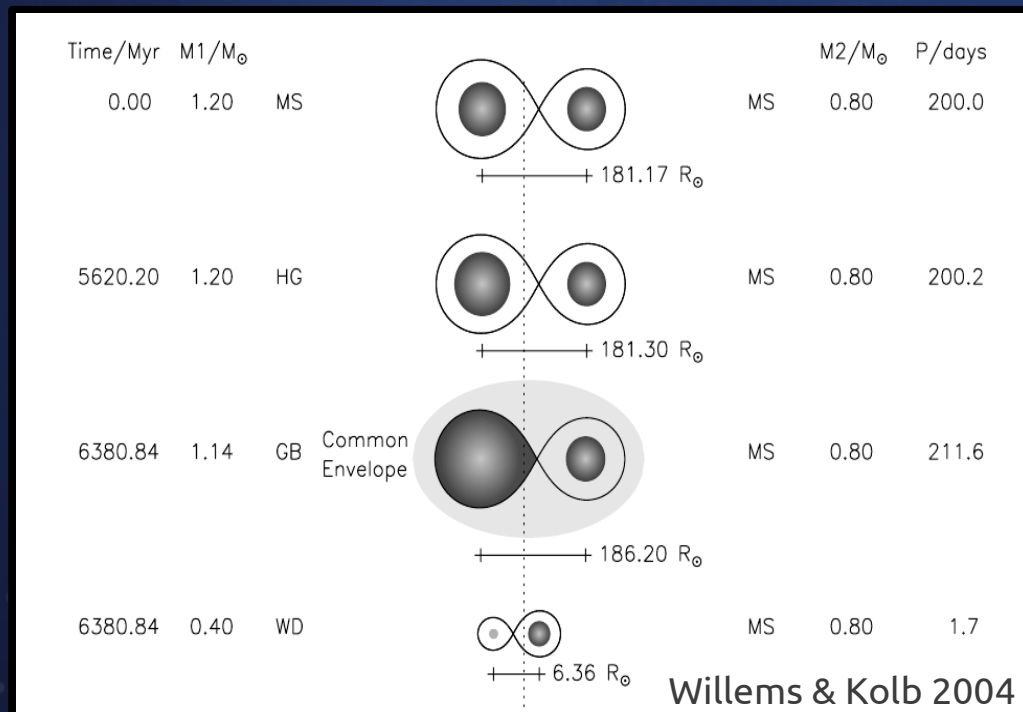

Intro: CV Menagerie

- One progenitor pop., but HUGE variety!
- Appear in all shapes, sizes, and flavors
 - Classical Novae
 - Non-Magnetic Systems
 - Nova-Like Systems
 - Magnetic Systems

Intro: "Standard" CV Scenario

- Start with wide binaries of moderate orbital period and unequal masses
 - Ritter 2010 review & references therein
 - Also everyone who talked yesterday

Intro: UV Observations

- Increasing number of strange C/N ratios seen in UV spectra (~13-15 currently)
 - Presence of CNO processed material!
 - Gänsicke et al. 2003; Gänsicke 2004; de Martino and Gänsicke 2009; Sanad 2011
- Really strong N V, very weak C IV
 - C IV can be completely absent!
 - (seen in other lines as well, e.g. C III 1247Å)

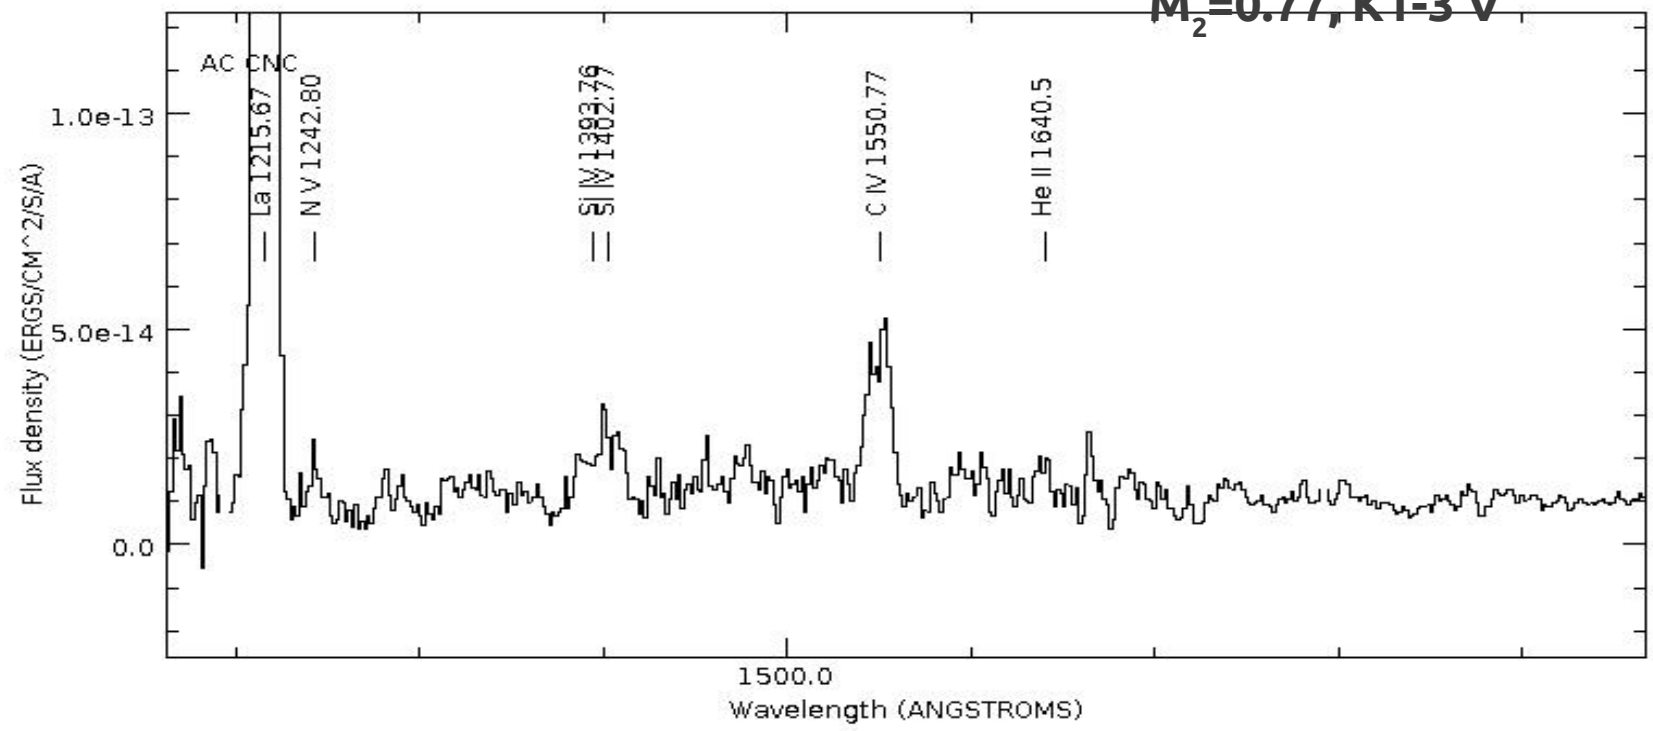

Intro: "Normal" CV in UV

X axis: WAVELENGTH | Y axis: FLUX | Print

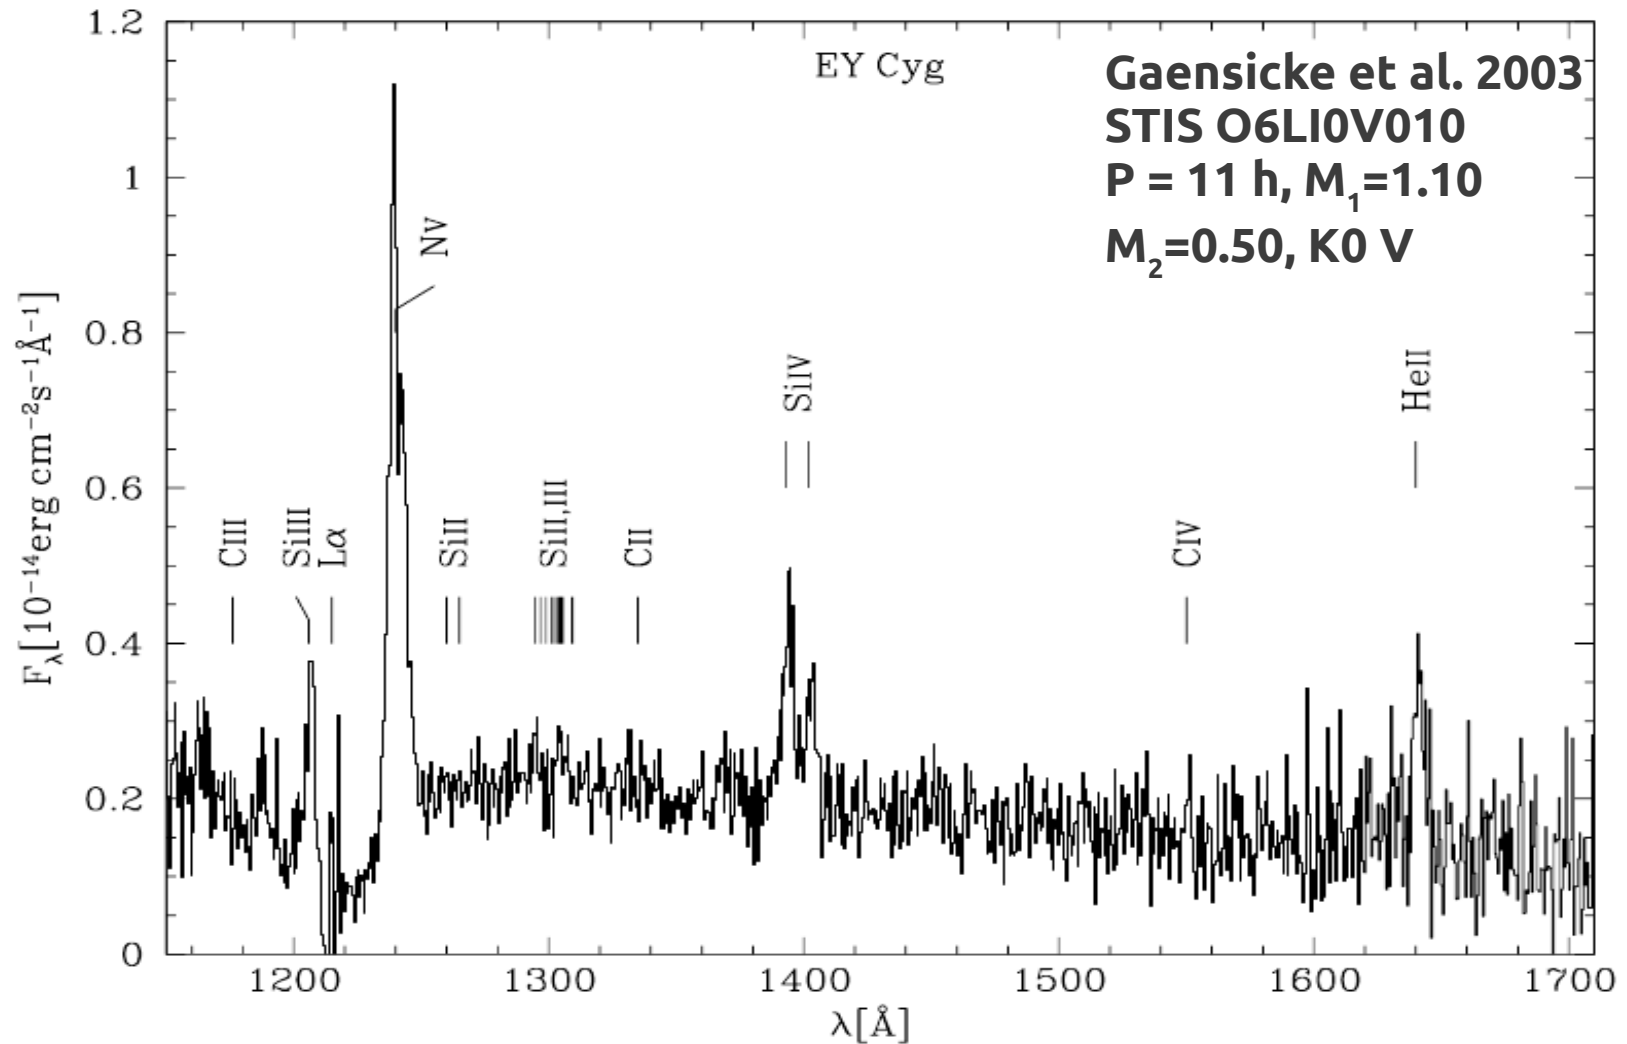

Grid off | Auto | Smooth | Call | Plot | Zoom In | Zoom Out | Pan

AC Cnc: HESWP18731
P = 7.2 h, $M_1 = 0.76$
 $M_2 = 0.77$, K1-3 V

Pan

Intro: "Weird" CV in UV

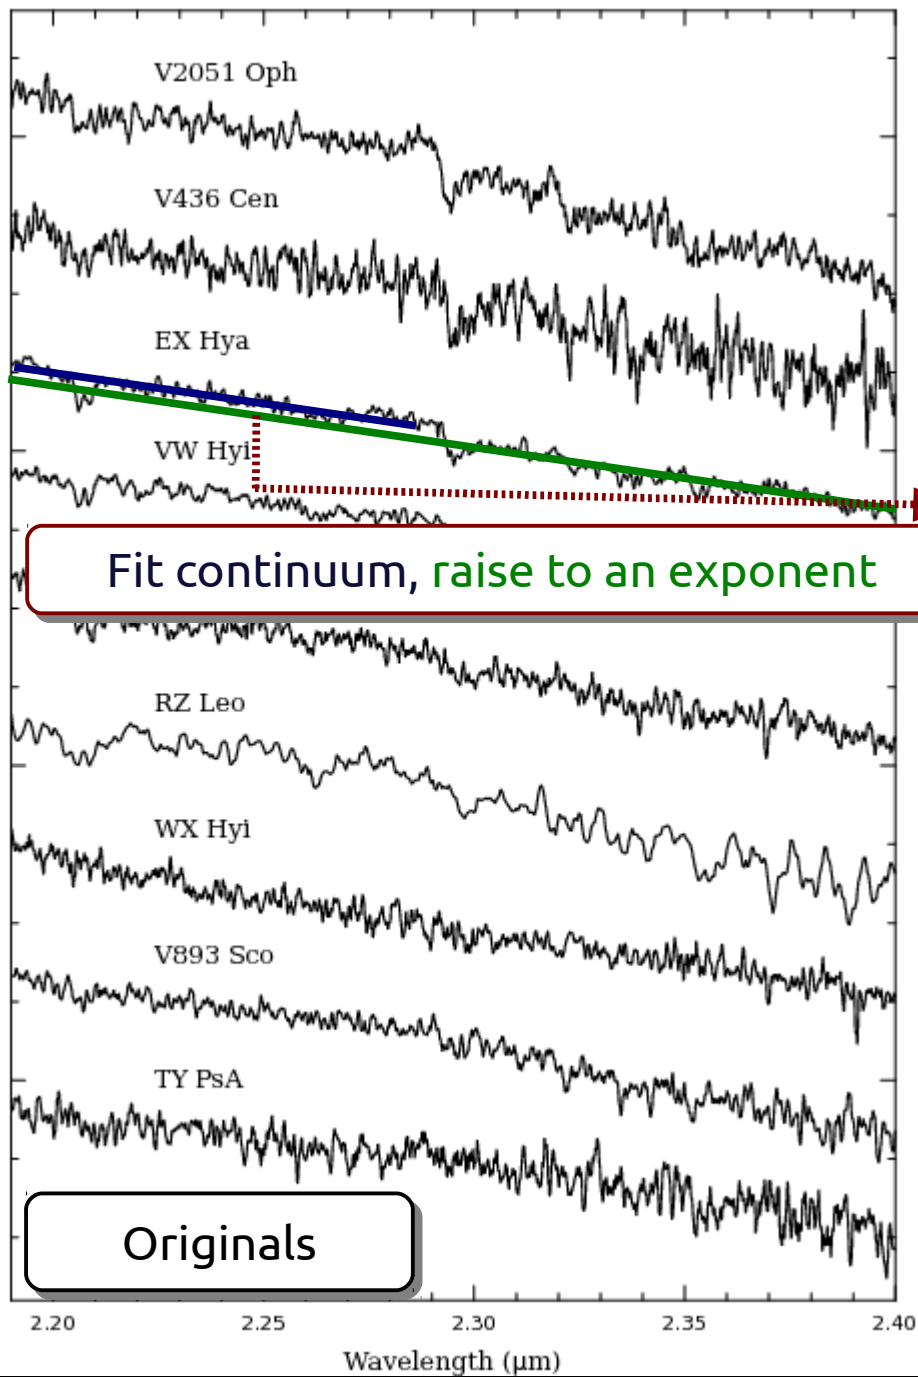

Intro: NIR Observations

- Increasing number of strange CO bands seen in NIR spectra
 - CO bands weaker than expected for given spectral type or just not there
 - Especially in long period systems above gap
 - Deficit of C, O, or something else?
- ^{13}C enhancements seen as well
 - More ^{13}C means the secondary star had nuclear processed material before contact!

Intro: “Normal” CVs in NIR

- Taken from Hamilton et al. 2011
- Doubled the sub-gap NIR sample
- Systems below period gap harder to detect
 - Faint, later type secondaries than systems above the gap
 - Short P_{orb} makes it difficult since K_2 is so high
 - Need short exposures (LARGE telescopes) to resolve anything of use

Arbitrary F_λ

UV-NIR Connection

- Cases where have both UV and NIR spectra, see CNO material
 - UV: High N V, Weak C IV → CNO material
 - **NIR: Weak CO, enhanced ^{13}C → CNO material**
- **Tracing CNO processed material from the secondary to the WD/disk**
 - Require initially more massive secondaries
 - Different progenitor population? **Thermal-Timescale Mass Transfer (TTMT)?**
 - Schenker et. al (2002)

More Massive Secondaries...?

- If secondary initially r...
has time to chemically...
- Marks & Sarna 1998

| Model | M_{1i} [M_{\odot}] | M_{1f} [M_{\odot}] | M_{2i} [M_{\odot}] | M_{2f} [M_{\odot}] | P_i [d] | P_f [d] |
|-------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|--------------|--------------|
| 46 | 1.2 | 1.068 | 1.5 | 0.185 | 1.166 | 1.092 |
| 47 | 1.0 | 0.864 | 1.25 | 0.138 | 0.909 | 0.127 |
| 48 | 0.8 | 0.692 | 1.0 | 0.126 | 0.709 | 0.080 |

So What Will We Do?

- Abundances:
 - Weak CO → C deficit? Is ^{13}C really enhanced?
 - Synthetic spectra to answer
 - Use two different codes/models
 - Find best match to given observations in a robust and repeatable way
- Need to understand systematics, biases, and uncertainties in the sample
 - Require homogeneous data reductions?

NIR Sample Stats

- Most observed at $2000 \leq R \leq 6000$
- Few (6-7) observed at $R > 10000$
- 61 systems total:
 - 19 Pre-CVs
 - Some at $R \sim 1500$ but no disk contamination
 - 31 Non-magnetic systems
 - 19 above the gap, 12 below
 - 11 Magnetic systems
 - Includes IPs as well

The Big List

Table 4
CO Absorption Strength Across all CV Subtypes

| Magnetic Systems | | | | |
|------------------|----------|------|----------------|----|
| GK Per | DN Na IP | 47.9 | W | 3 |
| AE Aqr | NL DQ | 9.86 | W ^f | 7 |
| V1309 Ori | NL AM | 7.98 | W ^g | 8 |

| ET Psc | DN SU | 1.07 | N ^o | 1 |

Summary of Strange Systems:
See Hamilton et al. 2011

0 Pre-CVs (0%)

13/19 - Long Period Non-Magnetic (68%)

3/12 - Short Period Non-Magnetic (25%)

3/11 - Magnetic, includes IPs (27%)

Notes. Only objects with NIR observations in the K band with $R \gtrsim 1500$ are included. A colon next to the orbital period indicates an uncertain result.

^a Y = appears normal for spectral type; W = appears weaker than normal for spectral type; N = not present, but should have been for spectral type; ND = not detectable; ? = too low S/N; and E = emission.

^c Sion et al. 2000; Gansicke et al. 2003.

^d Long & Gilliland 1998.

^e Gansicke et al. (2003).

^f Jameson et al. (1988).

^g Szkody & Silber 1998; Seemil & Stockman 1998.

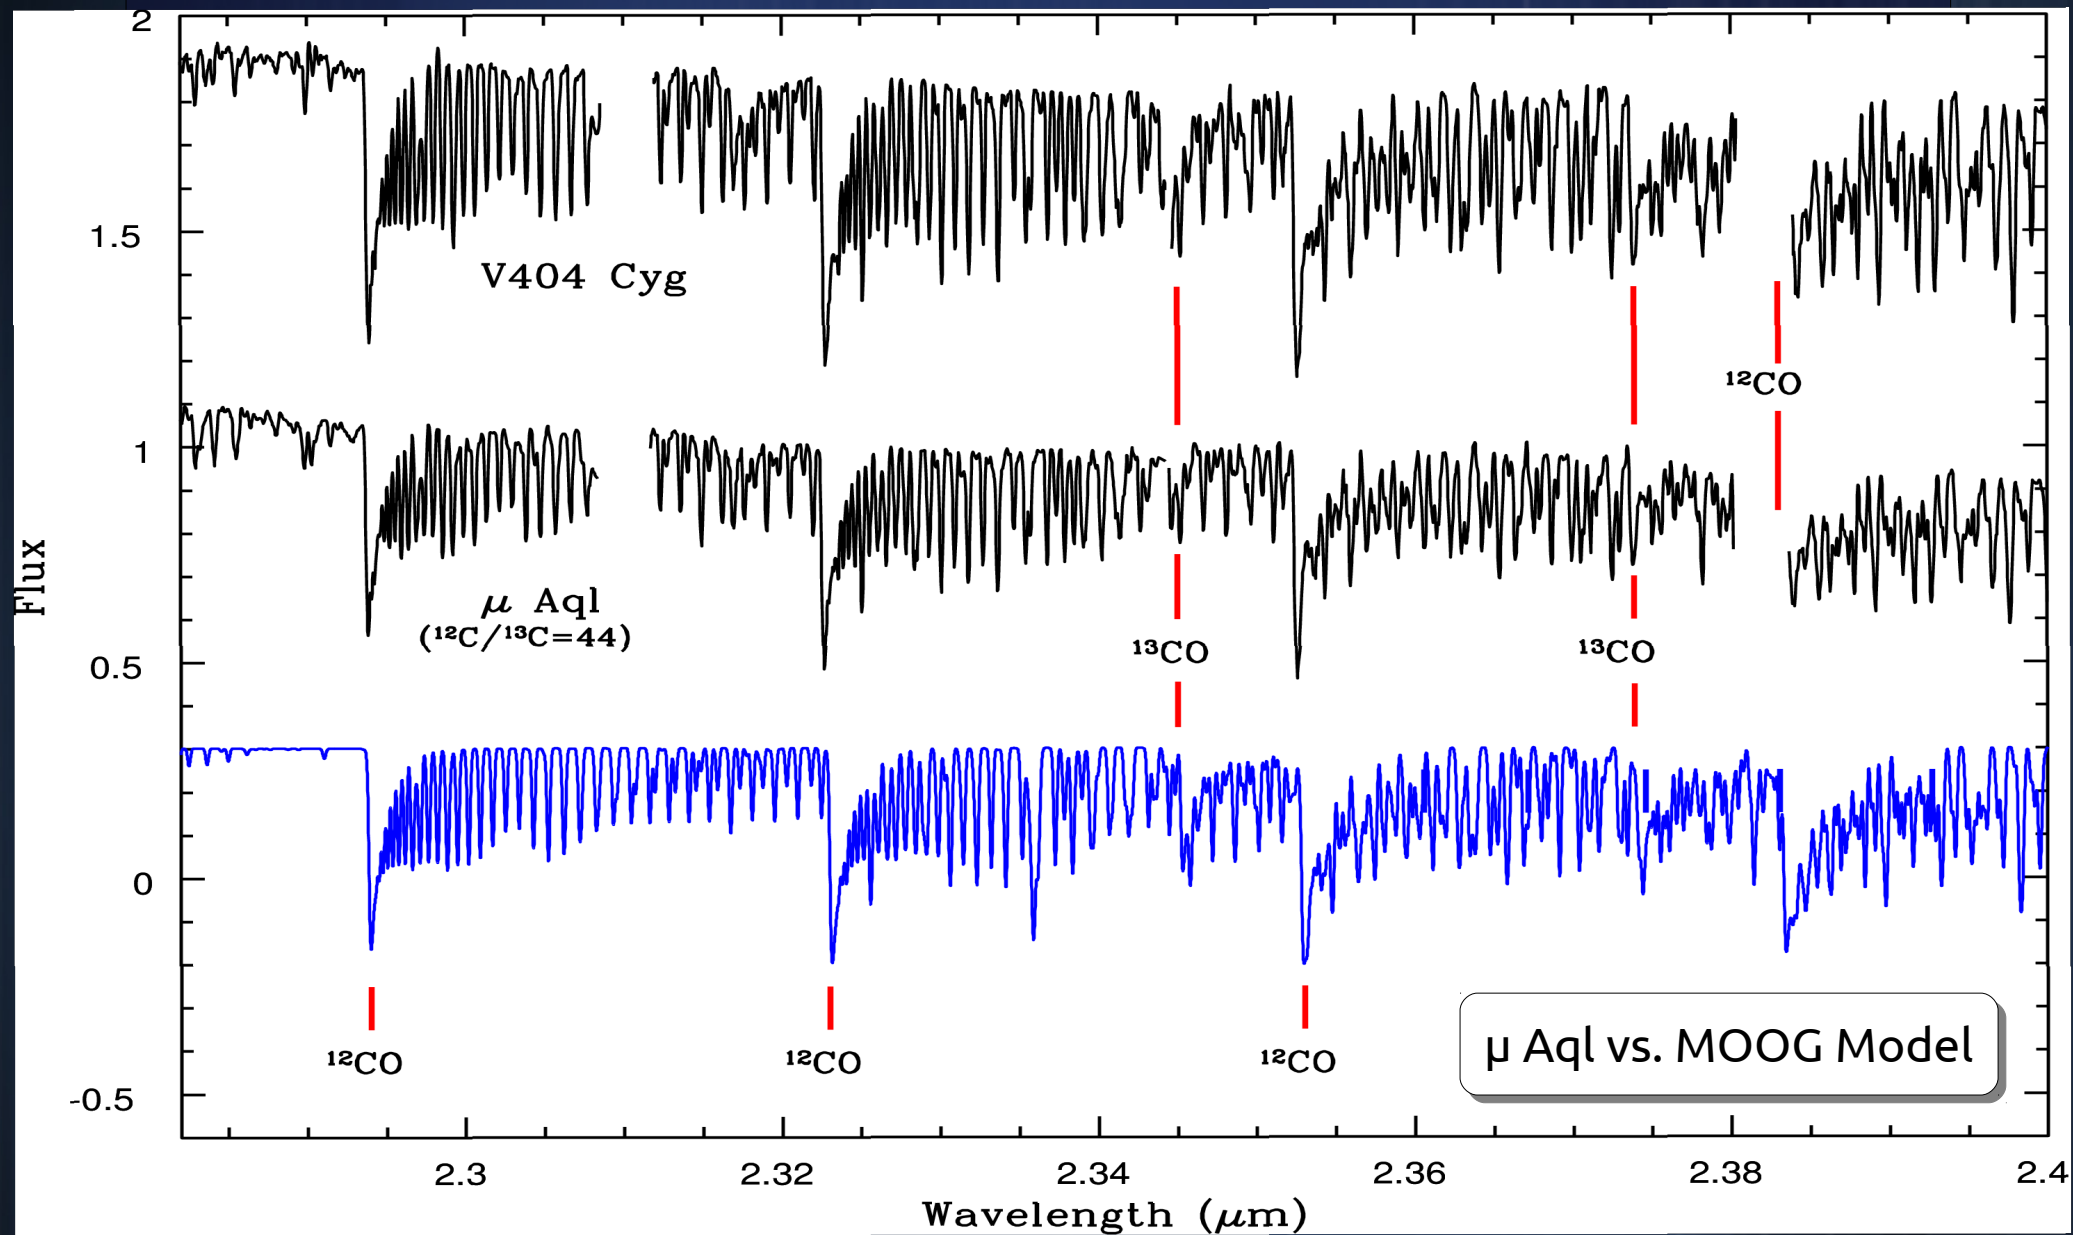

^h Very early spectral type, G1.5V so CO bands are not prominent.

ⁱ Third light contamination in the system, see North et al. (2000).

Modeling the Big List

- MOOG
 - Chris Sneden, UT Austin
 - LTE only
 - Bring your own atmosphere and linelist
 - **Does Not Handle Triatomic Molecules (H₂O)**
 - Extremely common and well used
 - **FAST computations**

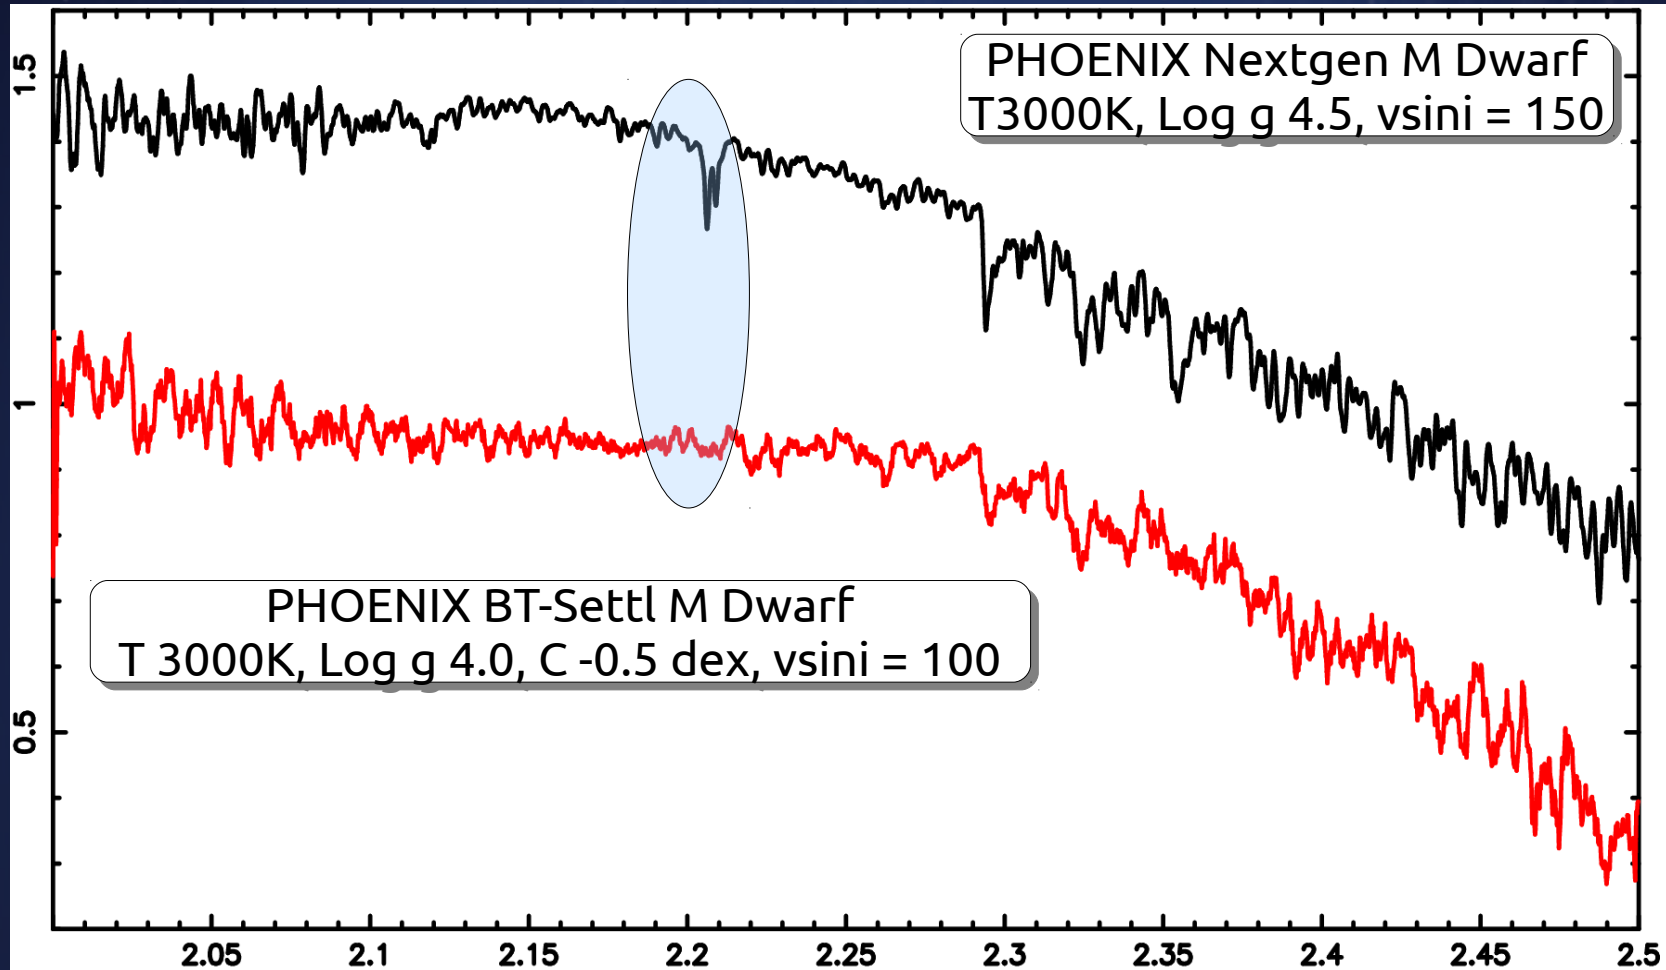

Sample MOOG Spectra

Modeling the Big List

- PHOENIX
 - Peter Hauschildt (et al.)
 - LTE/NLTE
 - Complete (complex) package
 - **Handles All Important Species/Molecules**
 - **Can include irradiation by other source (WD)**
 - ****Gold standard for cool star community****
 - **SLOW computations (~days/weeks)**
 - Available through (buggy) web-based interface

Sample PHOENIX Spectra

(Very Near) Future Work

- Fit highest resolution spectra first
 - PHOENIX for mid-late M dwarfs, else MOOG
 - M-K dwarfs, CVs, IRTF templates w/ known parameters
 - Fit lower resolution observations of these same objects to sanity check
- Once sufficient agreement in fitting, move down the list in terms of resolution
- Results coming soon! Too early to show

Summary

- Short period systems mostly normal
- Pre-CV/Magnetic systems appear mostly normal as well
- Long period systems strange
 - 13/19 show weak/absent CO features (~70%)
 - Some enhanced ^{13}CO (Harrison et al. 2005)
- Synthetic spectra to play with
 - C abundance imply more massive secondary star progenitors?
