

# Remnant Globular Cluster Streams in Galaxy Halos

Michael West  
Maria Mitchell Observatory  
Lowell Observatory (after Aug 2015)

- Globular clusters as tracers of streams
- G1: globular cluster or galaxy?

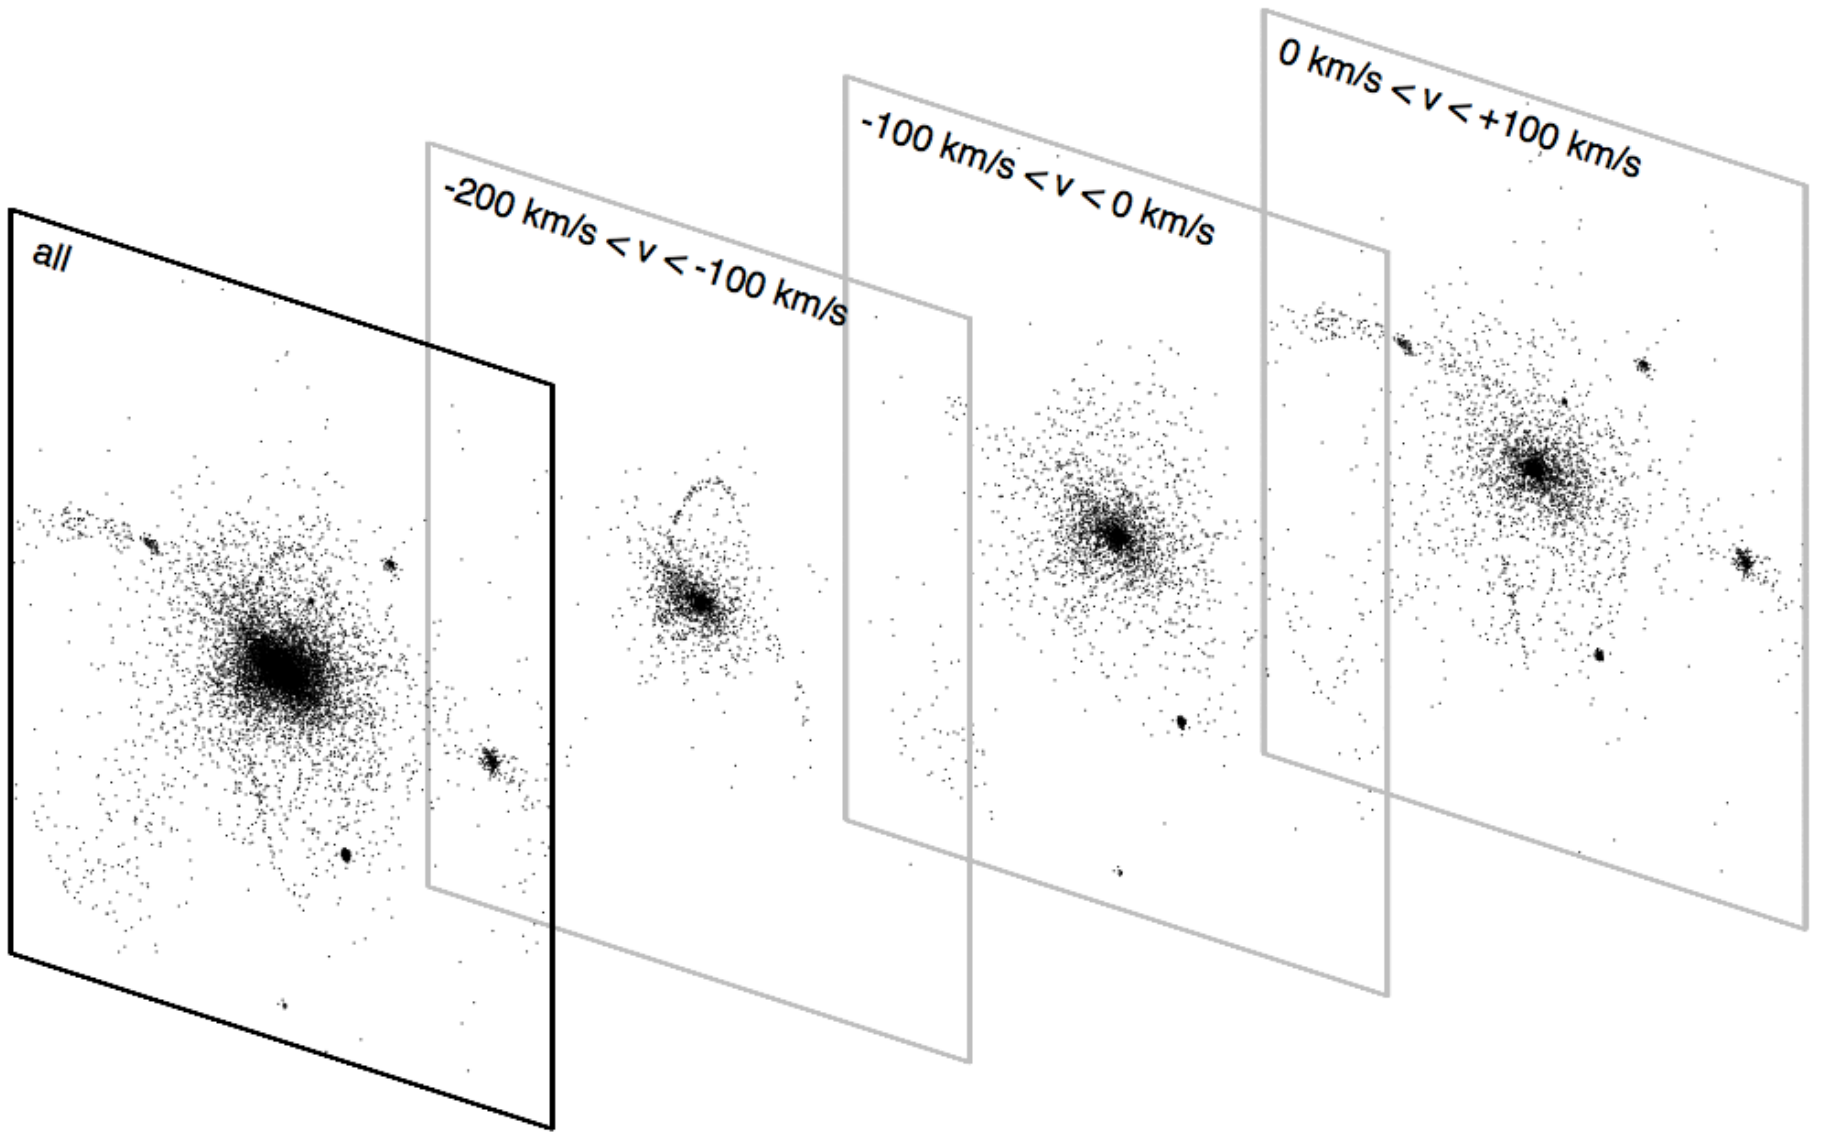

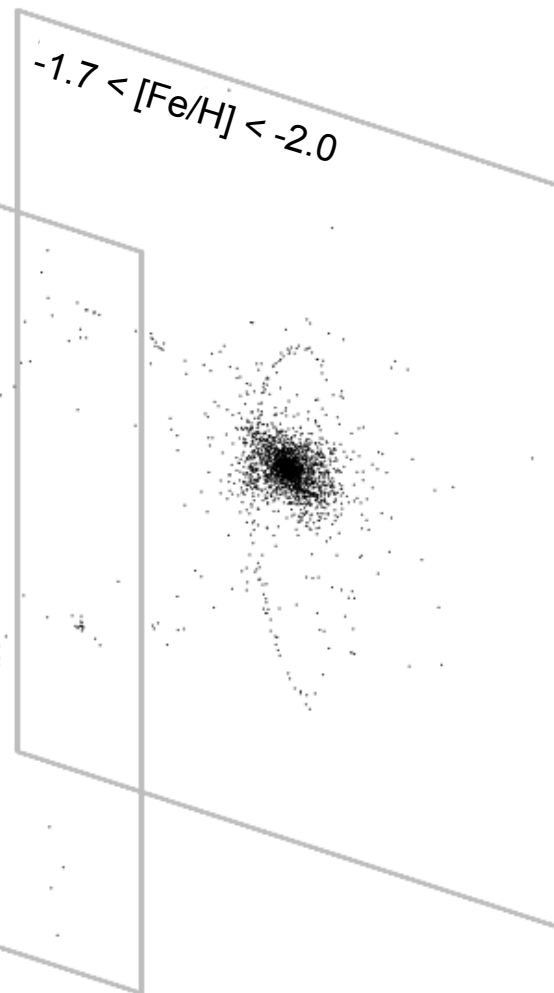

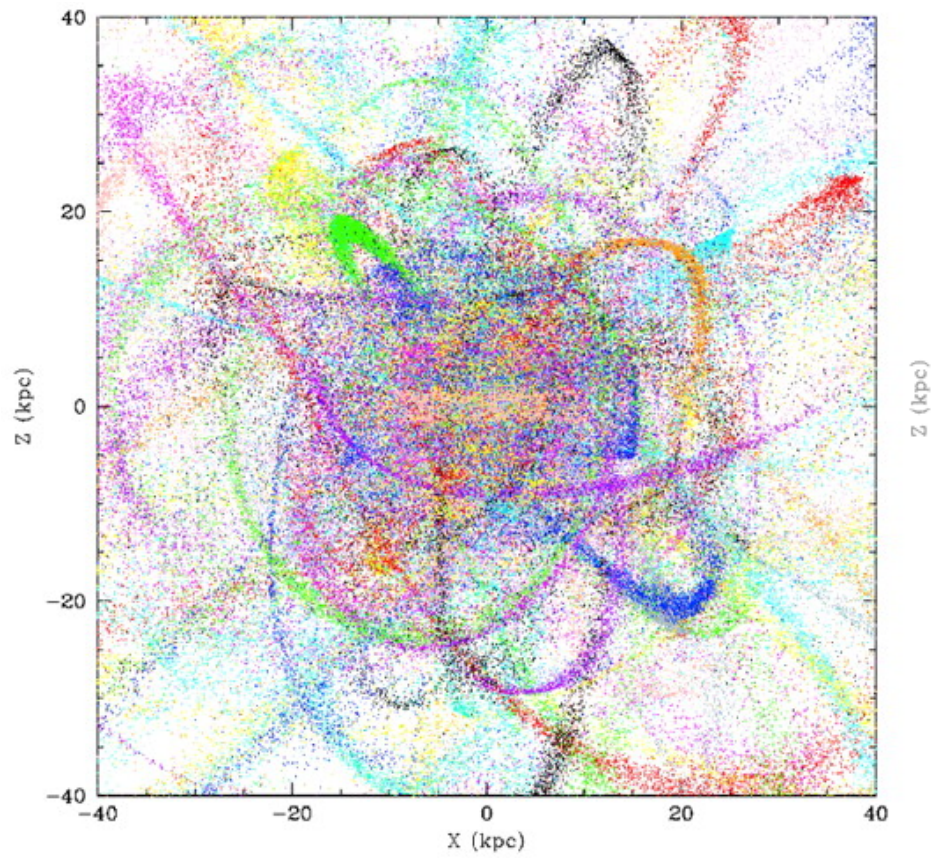

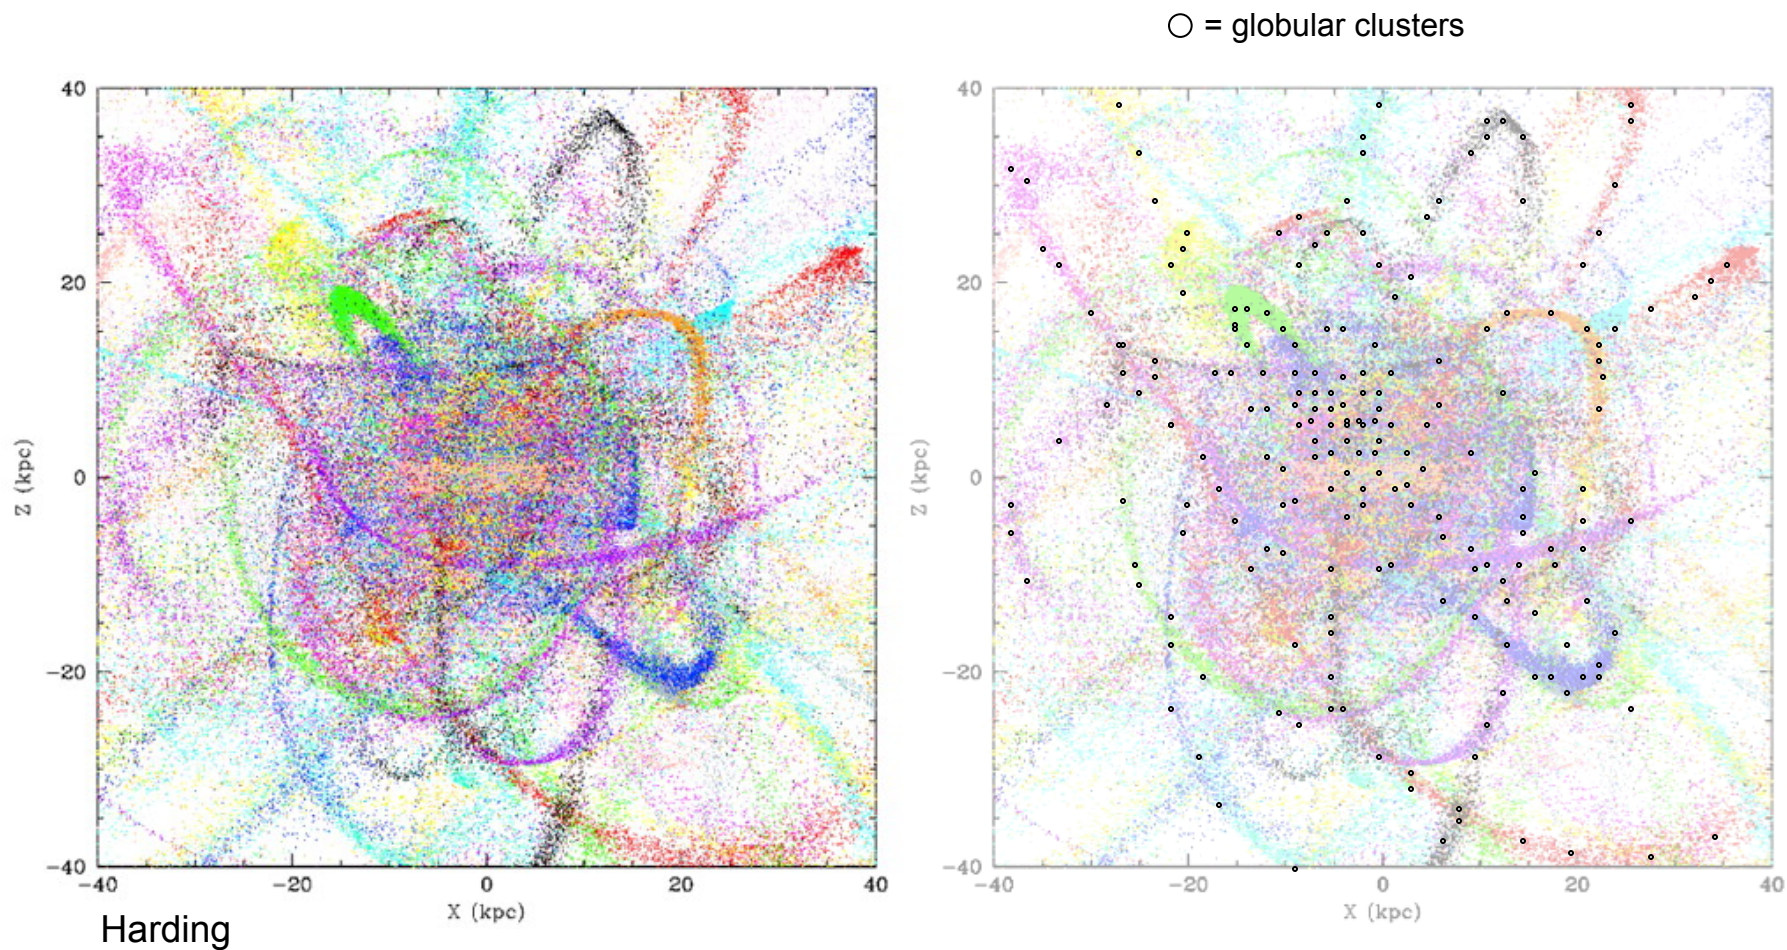

Harding

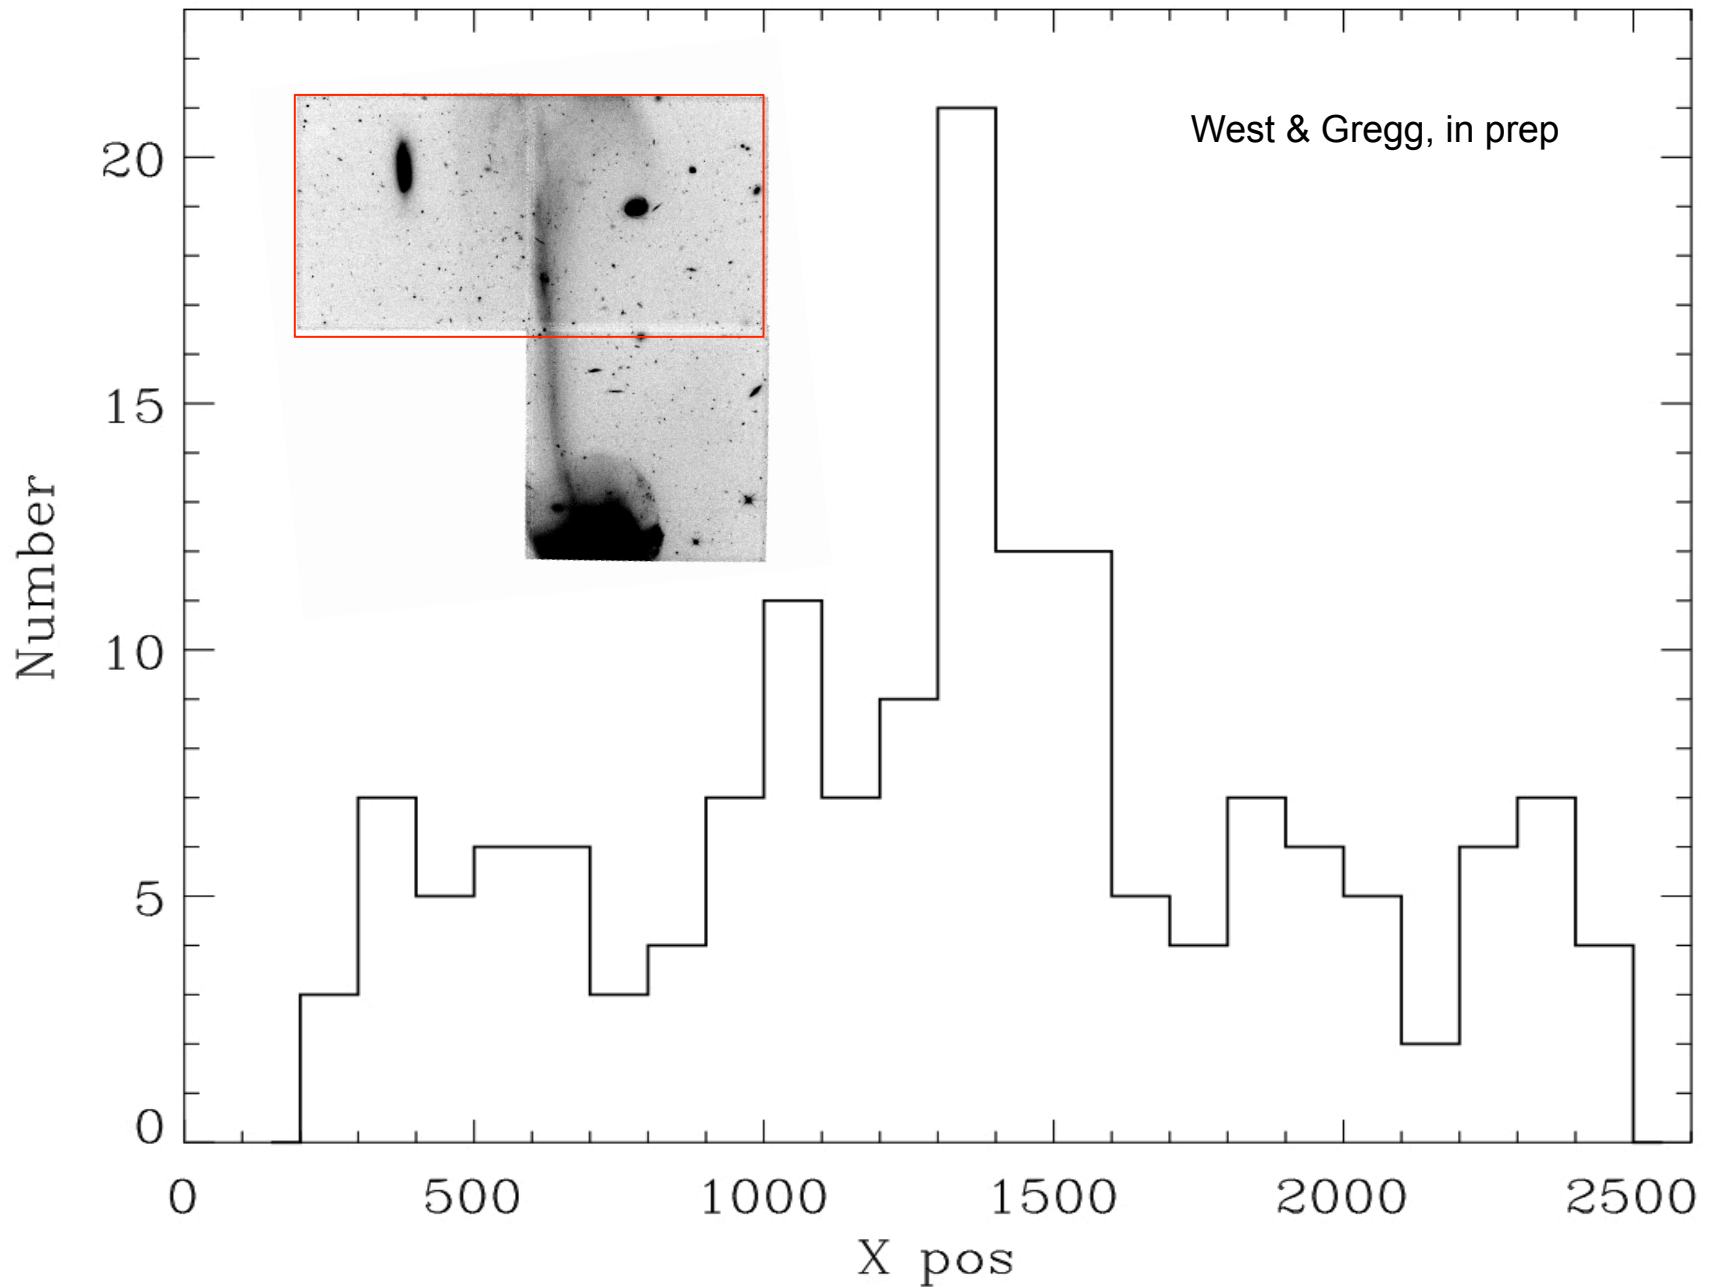

Globular clusters are sparse but luminous tracers of streams

# Globular clusters in Arp 105's tidal tail

# Can we detect remnant streams of globular clusters in galaxy halos?

# Hough Transform

*detects lines in noisy data  
as maxima in parameter  
space*

*coordinate transformation  
with voting*

# Many uses of the Hough transform...

## Oddities about G1:

- Most massive known globular cluster  
 $\sim 10^7$  solar masses
- Stars have a range of chemical composition
- Elongated shape
- Home to an 20,000 solar mass black hole

# Globular clusters known to have black holes

Andromeda Galaxy  
(2.2 million light-years  
from Milky Way)

# M31 rotation curve

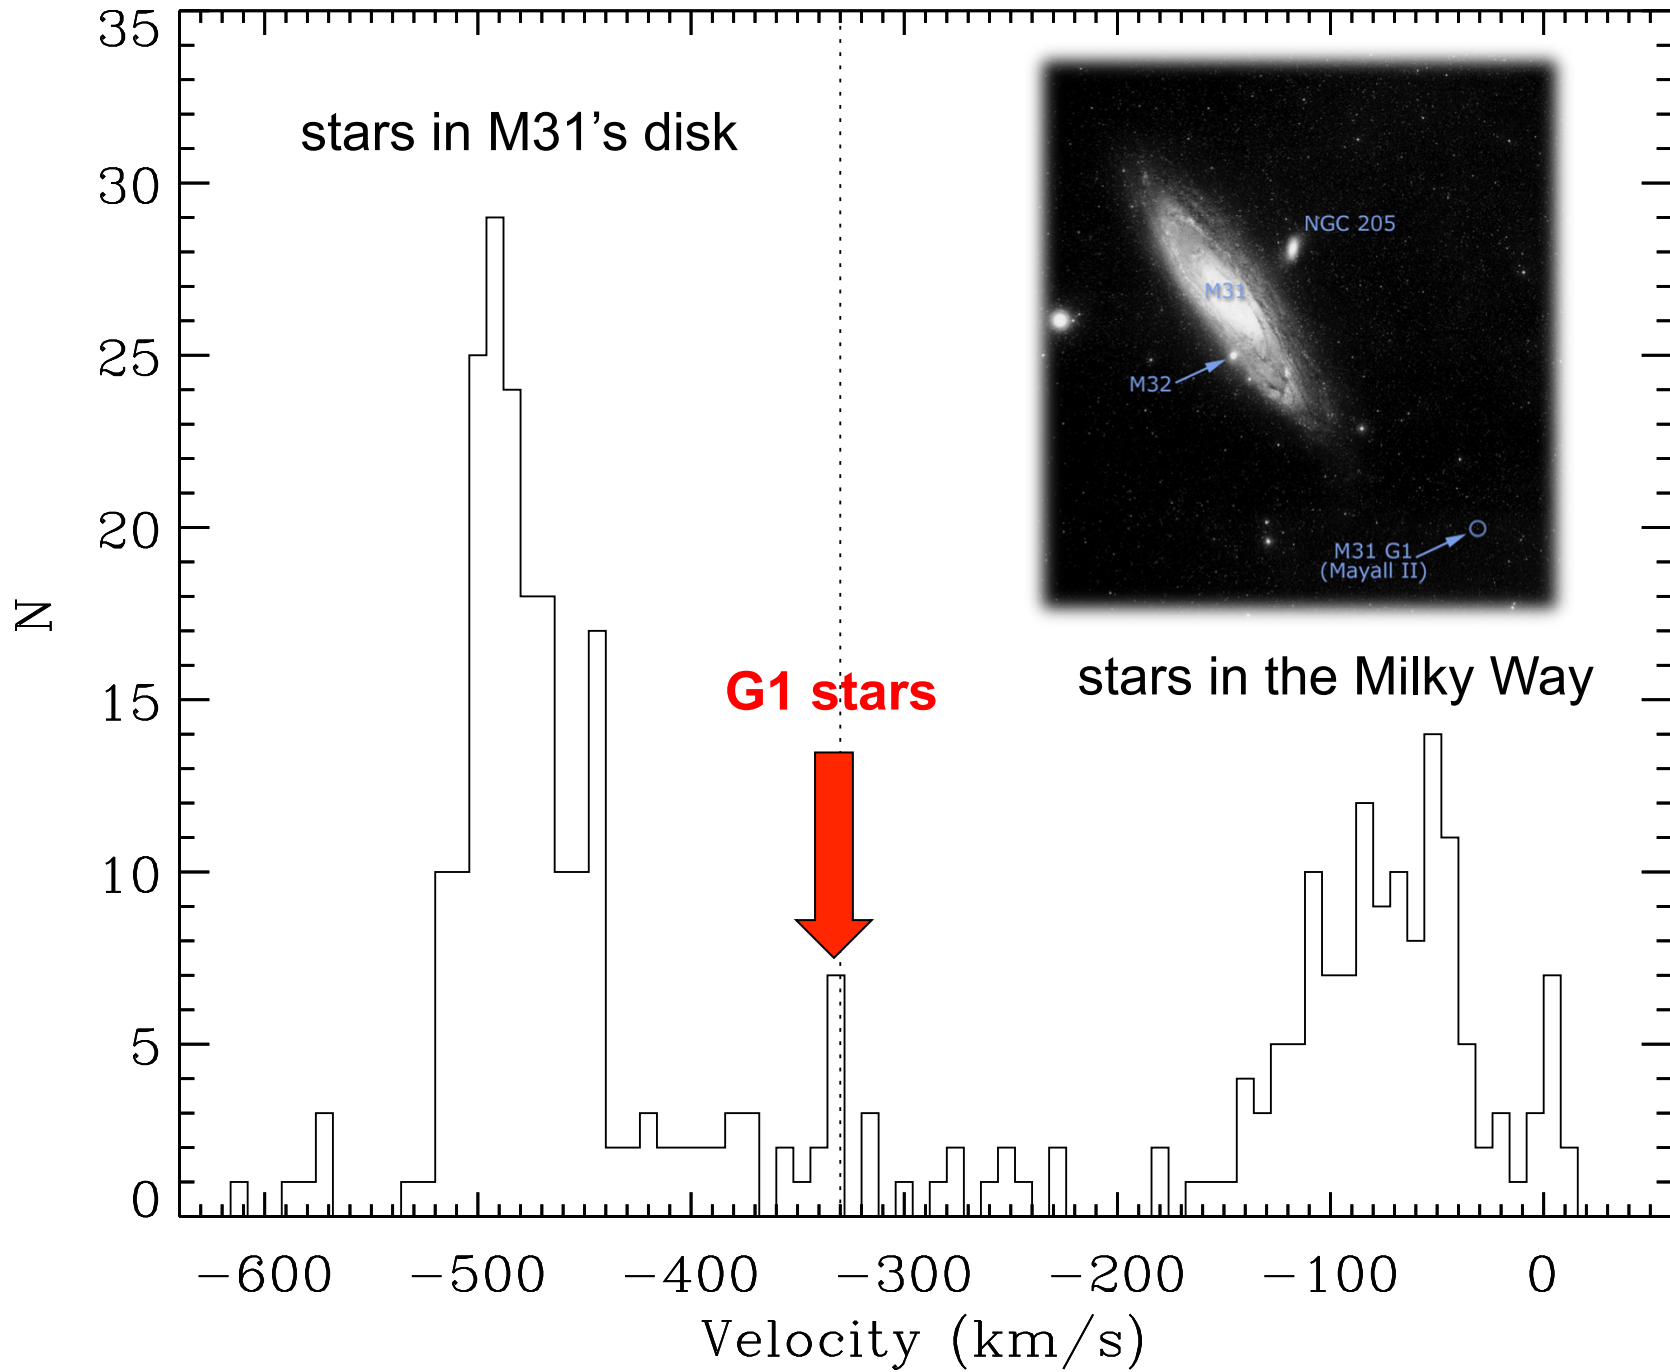

A photograph of the Keck Observatory dome at sunset. The dome is dark and silhouetted against a vibrant sky transitioning from orange at the horizon to deep purple at the top. The interior of the dome is illuminated, showing the complex structural framework. The foreground is dark, showing the silhouette of the mountain ridge.

Keck observatory

We used DEIMOS to measure velocities of 351 RGB stars around G1 to look for evidence of stripping

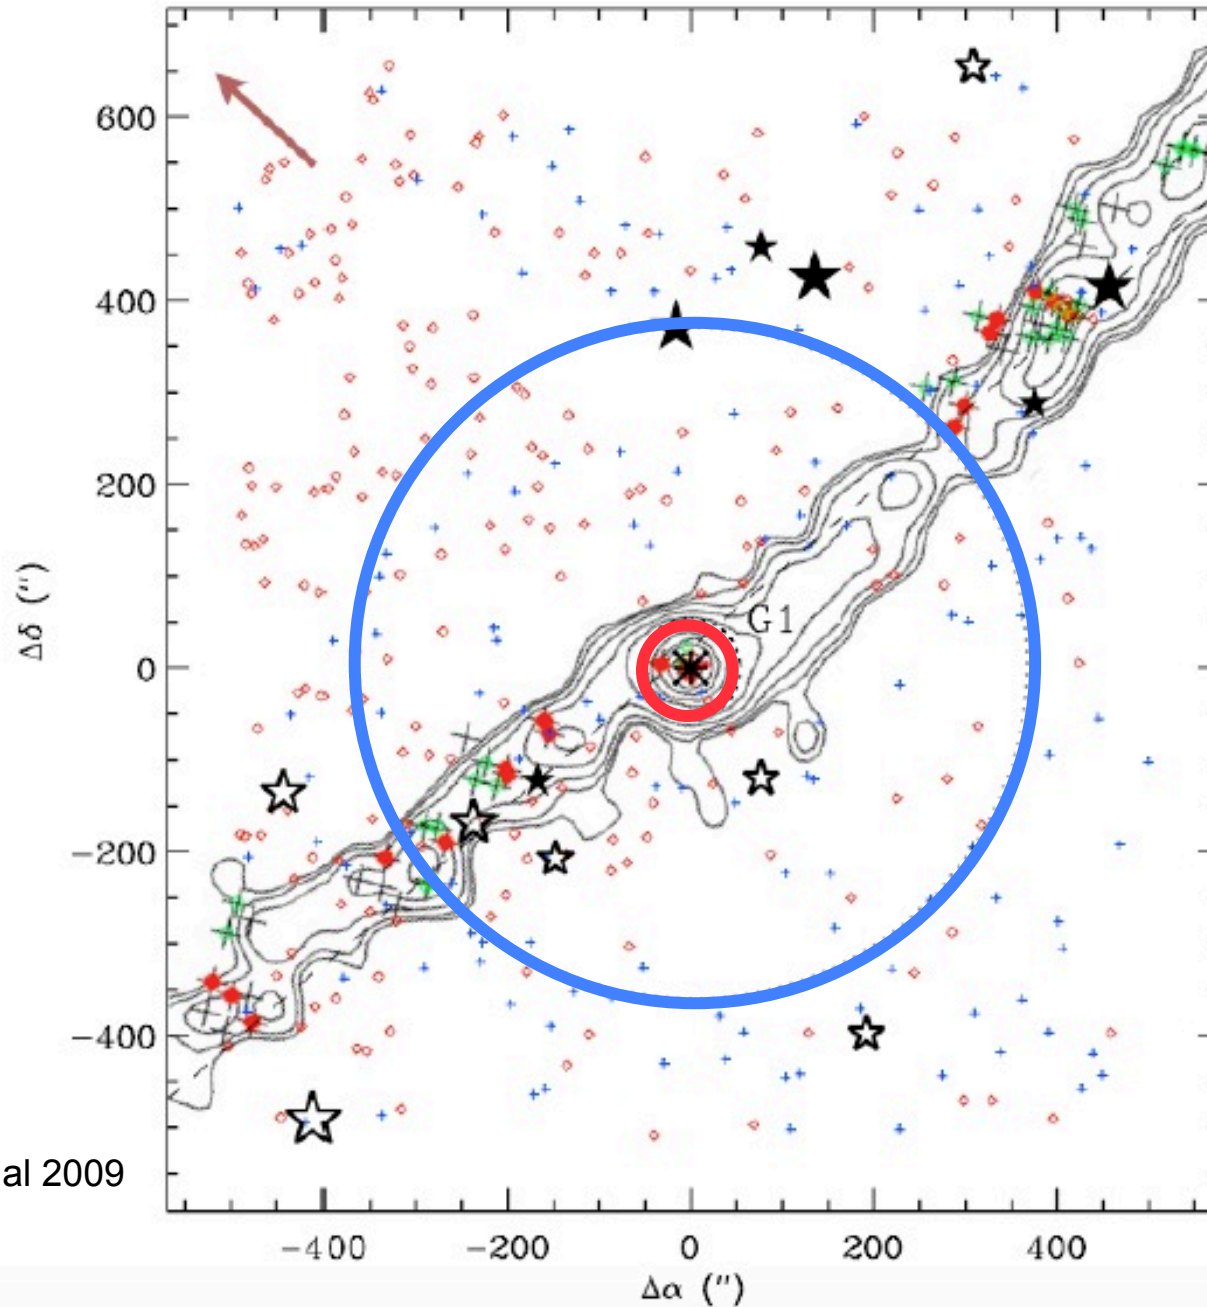

# Spatial distribution of stars within +/- 25 km/s of G1

# G1 stream compared to Pal 5 stream

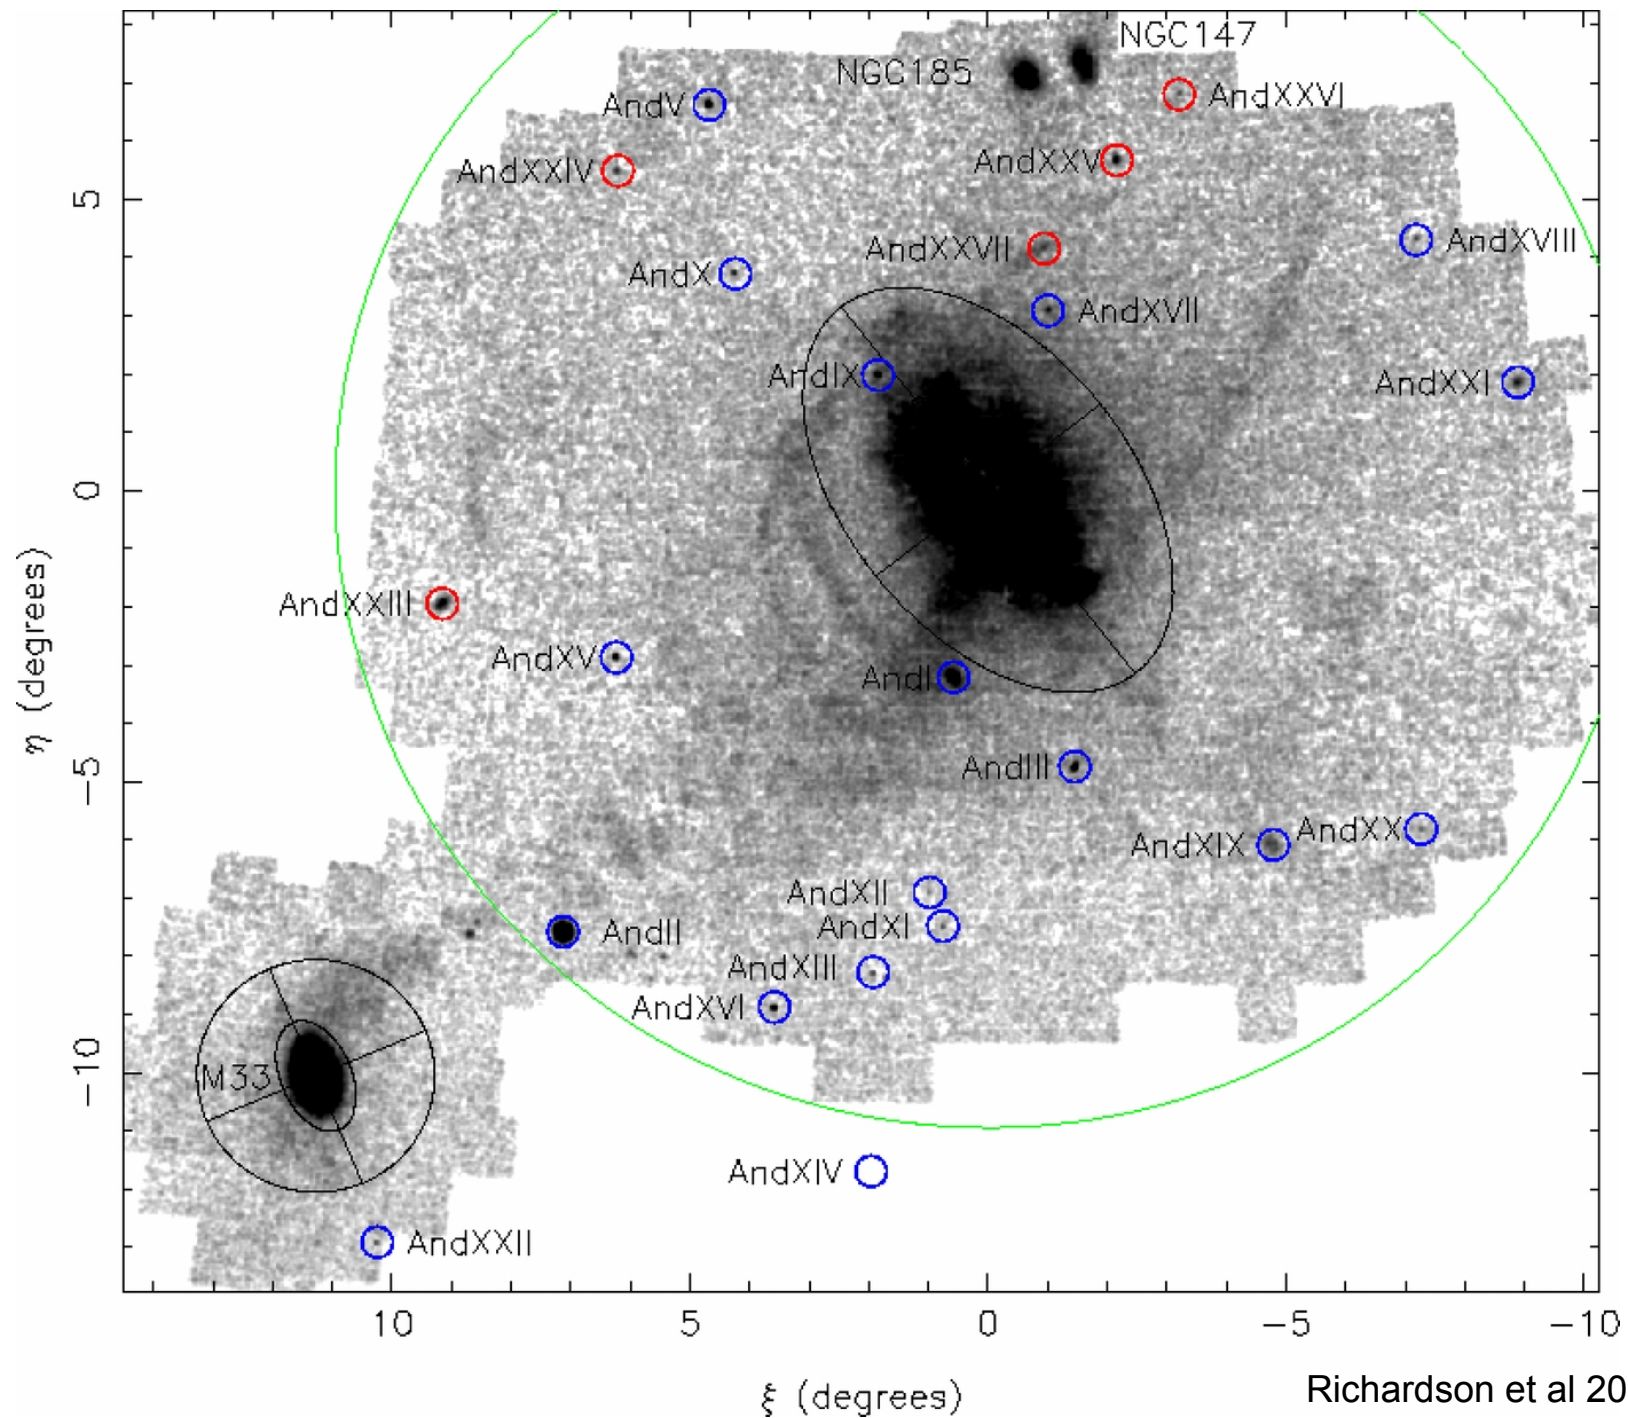

Odenkirchen et al 2009

# Conclusions

- Remnant streams of globular clusters can be detected using computer vision techniques
- G1 is the surviving nucleus of a once larger galaxy
